Normal wbc for women

Healthy blood contains a certain percentage of white blood cells (WBCs, leukocytes or leukocytes) that, as part of the body's immune system, help the body fight the infection. A White Blood Count (WBC) measures the amount of white blood cells in a person's blood sample. The number of white blood cells in the body differs between individuals or at different ages in their lives. The normal range for a white blood count on a healthy adult is between 4,000 and 11,000 WBCs per microliter (µl or MCL) or cymbian millimeter (MM3) of blood, although this can differ between men and women, and children. The healthy range for children and young people usually have more. To measure the white blood cell number of the blood in a person's body, a white blood count, often as part of a complete blood count test (CBC). A low white blood count may indicate conditions, including infections, inflammation, certain types of cancer, HIV / AIDS and others, making it an important diagnostic test. In addition to these conditions, a person's white blood cell count may indicate its activity of the immune system, response to the treatment of cancer and general health. The White Blood Cells (WBCs) There are several types of white blood cells (WBCs), including neutrophils, eosinophils, lymphocytes, monocytes and basophils. Each variety plays a different role in the protection of the body of foreign pathogens, such as virus, bacteria, fungi and parasites. The white blood cells also defend the body of bacteria, mutant cells, such as cancer and strange material, like chips, and remove dead cells, old red blood cells and other debris. A white blood count checks the global levels of white blood cells in the blood as well as the general proportion of different types of white blood cells. White Blood Count (WBC) Tell the threshold for a low white blood count (leukopenia) varies between individuals and cases, but is generally considered anything smaller than 4,000 white blood cells by blood µl in an adult. A low white blood count can be caused by conditions, including: viral or bacterial infection decreased autoimmune history of Cancer Cancer, including rheumatoid arthritis and leukemia treatment Lupus tuberculosis tuberculosis Like radiation and chemotherapy, all of other medicines Anemia applies to the low white blood count can cause symptoms such as fever, chills, headache and bodyache. If you are experiencing symptoms that may be related to a low white blood count or one of the underlying conditions associated with it, start your personal health assessment with the ADA application now. White Blood Count (WBC), although it varies between individuals, a high score of white blood cells (leukocytosis) is usually considered anything above 11,000 cells by blood µl in an adult. This can be related to: infection medications autoimmune medications such as rheumatoid arthritis Leukemia allergies tuberculosis whooping cough myelofibrose stress smoking in most cases, there are no specific symptoms related to a white blood count Elevated white, although symptoms associated with the underlying condition can occur. However, in extreme cases, as when leukocytosis occurs due to a condition that affects the cord, symptoms directly related to a high count of white blood cells may occur. If you are experiencing symptoms that may be related to a high white blood count or one of the underlying conditions associated with it, start your personal assessment of health with the ADA application now. White blood cell counts during pregnancy typically, white blood cell counts are high during pregnancy, with the lower limit of the reference interval being about 6,000 For µl for about 17,000 cells per µl. The stress imposed to the body through pregnancy causes this increase in white blood cells. During delivery and in the following hours, white blood cell count anywhere between 9,000 and 25,000 white blood cells by blood µl. The white blood count usually returns to normal around four weeks after delivery. Read more about Pregnancy and Pregnancy Complications "Normal White Blood Cell (WBC) count a normal count of white blood cells is a reading that falls within an established interval through the test of men, women and children of all ages. Although it is possible to cite general values, the exact ranges tend to differ between laboratories and countries. For men, a normal count of white blood cells is between 5,000 and 10,000 white blood cells for blood µl women, is a reading between 4,500 and 11,000 per µl and for children between 5,000 and 10,000. Not all sources, however, differentiate between male and female values; of these sources, values for both sexes tend to stay in the interval between 4,000 to 4,500 and 10,000 to 11,000 cells per µl. Test procedure to perform a white blood count, a doctor will draw a blood sample, usually of a vein in the arm or in the palm of the hand. This is a common procedure, and side effects are rare, but may include dizzy, bleeding or infection. No special preparation is necessary for a white blood count, but a person must inform their medications that they are taking, as this can affect the results. A white blood cell count is usually taken as part of a complete blood count. Read more about a complete blood count »White blood cell counting FAQs: what is a healthy white blood cell count »
