PRL-444B 1/4 TTL Fanout Line Driver

High speed 50 ohm line driver. 50 ohm line driver ttl. 50 ohm line driver op amp. 50 ohm line driver ic. 50 ohm line driver buffer. 3.3v 50 ohm line driver. 50 ohm line driver circuit. Cmos 50 ohm line driver.

74AC11648NT: Registered transceivers. IT 74AC11648, octal bus transceivers and records. 74LVTH162244: CMOS / BICMOS-> LVT / ALVT / LCX / LPT Family-> Low tension. With a low-voltage low-voltage buffer / line controller with 3 states outputs and resistors of the series of 25 ohms in the outputs. CY74FCT373T: CMOS / BICMOS-> FCT / FCT-T family. 8-bit Latches. Function and Pinout Compatible with FCT and F Logic VOH reduction (typically 3.3 V) Versions of equivalent functions of FCT functions Embander type control for a Rudo characteristics M ... Operation of ESD operation exceeds JESD A, 2000-V Body model A, Material model to 200-V Model loaded 1000-V (C101). HD14011B: NAND door of the entrance when HD74HC280 . Regarding the change of names mentioned in the document, such as Hitachi Electric and Hitachi XX, to Renas Technology Corp. The semiconductor operations of Mitsubishi Electric and Hitachi were transferred to Renas Technology Corporation on April 1, 2003. These operations include microcomputer, logic , Analog and discrete devices, and memory chips. HD74LS26 . Regarding the change of names mentioned in the document, such as Hitachi Electric and Hitachi XX, to Renas Technology Corp. The semiconductor operations of Mitsubishi Electric and Hitachi were transferred to Renas Technology Corporation on April 1, 2003. These operations include microcomputer, logic , Analog and discrete devices, and memory chips. MC100E457FNR2: Multiplexers. 5V Triple ECL Differential 2: 1 Multiplexer. Package: PLCC, PINS = 28. MC10H166FN: 5-bit magnitude comparator. Package: PLCC, PINS = 20. The 5 CITES magnitude comparator and is a functional / pinout duplication of the Mecl 10k standard with a 100% improvement in the propagation delay and without increase in the of Supreme. He is a high quality expandable 5 cbit comparator to compare the magnitude of two binary words. Two outputs are provided: A B. The function = B can be obtained. MC74AC240: Autobis Bus Circuits Octal buffer / line conductor with 3 state outputs. He is an octal bucket and a line controller designed to be used as a memory address controller, clock controller and transmitter or receptor-oriented receptor that provides a better density of the PC board. Outputs from 3 states. Unit bus lines or memory memory records Source outputs / sink 24 mA ACT240 has TTL compatible entries Figure 1. Pinout: 20A e Lead driver packages. SN74ABT162245DGG: Standard transceivers. IT SN74ABT162245, 16-bit bus transceivers with 3 states outputs. SN74ABTH162460DGG: Registered transceivers. IT SN74ABTH162460, 4 to 1 multiplexed / demultiplexed registered transceivers with 3 states outputs. SN74LS382A: Bipolar family-> LS. Units of arithmetic logic / function generators. Production data information is updated at the publication date. The products are adjusted to S according to the terms of the standard guarantee of Texas Instruments. Production processing does not necessarily include evidence of all parameters. . TC74HC280: CMOS / BICMOS-> Family HC / HCT. 9-bit parity generator / verifier. XC74UL14AAM . NCMOS Schmitt Inverter Inverter NHIGH Speed Operation: TPD = 2.3NS Tip Nopecker Voltage Garge: 2V ~ 5.5V Nlow Energy Consumption: 1 Iva (Max.) He is an CMOS activation inverter Schmitt, manufactured with CMOS manufacture of the silicone door. The low power circuit operation CMOS causes high-speed LS-TTL operations to be achievable. With a waveform buffer connected internally. HEF4049BT-T: 4000/14000/40000 Series, 1 entrance hexagonal investment door, PDSO16. S: Door type: No; Supply voltage: 5V; Logic family: CMOS; Tickets: 1; Delay of propagation: 100 ns; Operating temperature: -40 to 85 C (-40 to 185 f); of pin: 16; Package type IC: SOP, Other, 3.90 mm, Plastic, MS-012, SOT109-1, SOP-16. SN74AS17ANS: ALS series, positive edge activated d flip-flop, true output, PDSO16. S: type of flip-flop; D; Activation: Activated positive edge; Supply voltage: 5V; Exit characteristics: true; Delay of propagation: 17 NS; Fmax: 50 MHz; Operating temperature: 0 to 70 70 (32 to 158 f); Type of package: Plastic, SO-16; Family LA *GICA: TTL; Pin number: 16. 74LV19PWH-T: LV / LV-A / LVX / H Series, 3-entry Triple NAND door, PDSO14. S: Door type: NAND; Supply voltage: 3.3V; Logic family: CMOS; Tickets: 3; Delay of propagation: 44 NS; Operating temperature: -40 to 125 C (-40 to 257 F); Pin's count: 14. We are trying to speak with several ICS of an FPGA controller. The ICS is logical of 5V, but they are supposed to operate up to 100 MHz. We have translation of the resolved level, but it is not sure how to drive the PCB trace. Due to the high speed and the relatively long distance, we must treat this as a transmission line with the proper termination. The problem is that at 5V a 50 ohm line needs 100 mA of unit resistance. The inverters / buffers of stronger handling force that I see in you (LVC family) can do 32MA, which means that we would need four in parallel to do this. The space of the Board is in a premium, so we would like to avoid this approach if possible. Any other suggestion? I considered an OP-AMP bucket, but the output voltage under load did not seem to meet the entry level requirements of the CMOS door. Maybe I need to find a better railroad amplifier to Riel? Page 2 18 Comments Comments
