The origin anticipates our future energy shock ©The Australian Terry McCrann February 19, 2022 The scale and coverage of total electricity and the wider energy disaster ©This is the most comprehensive statistical gift in which we are not even loosely understood. In this wind-dependent and carbon-deficient future?" whether or not with Áe??matÁ ©rias incuÁe? Áe??" when that happens, the national network will implode. Surely no state would cut itself off unilaterally from the rest, trendy beggar and neighbor? Australia's energy policy is a self-inflicted calamity driven by an obsession with intermittent, solar wind. Two years after Covid, it doesn't seem fanciful anymore. Can we even build Angus TaylorÁásÁe" plant with peak att. Now, it's been states closing their borders to keep Covid out. Insanity is bad enough, requiring these basic coal p to operate as peak carriers - retreating when the wind chooses to blow, having to fill when the wind is muted. Now we are well and truly there with Covid. The origin probably deserves our thanks Áe?" pronounced, indeed, through the teeth gratin. When the wind blows, it can get almost all its energy from that source. Their argument has been that if you don't spread the turbines wide enough geographically, the wind will always be blowing somewhere. Sunset and calm weather are the reason why wind and solar energy are never significant sources of energy. Somehow, I think we're going to continue to be troublesome. Before Thursday, we had the eÁÁÁacomfortableÁÁÁ assumption that the future started around 2032, the previous planned date of the Eraring closure. Adding insult to injury. The closure of Eraring in 2025 will fundamentally destabilise that already delicate balance. This was rather neatly captured in the headlines at the non-insane end of the media spectrum in reaction to the Eraring closure announcement. What these maniacal wind and solar obsessed policies are doing is not only wrecking the ability of coal-fired generators to remain in business, the resultant power rationing and price spikes will simply drive every last energy-hungry industry offshore. Despite the twitterings of the market operator AEMO, after 2025 we will not have enough firm 24/7 dispatchable power across the national grid eÁÁÁ South Australia, Victoria, NSW, Queensland and Tasmania eÁÁÁ and it is only going to get worse from there. NSW and Victoria also share their surpluses and their deficits; and both draw power from QueenslandeÁÁÁs coal stations and occasionally send power north. Wind power is only delivered when the wind is blowing at a sufficient and constant speed, and solar is only delivered when an unimpeded sun is shining during the period between sunup and sundown. Neither of them is game to use the eÁÁÁÁeÁÁÁ word in public, as if their Liberal party were chasing Green-held seats in Brisbane, Sydney and Melbourne. A few thousand workers having to, for want of a better word, re-skill as Amazon warehouse workers or learning to code. The template has been established. Pathetic doesn'tÁÁÁÁ cover it. And even that is assuming that the wind does blow occasionally, and the ageing under-maintained remaining coal plants continue to operate with minimal time-outs. But these characters sound more like spin doctors for the wind and solar industries than champions of industry, business and trade. The first blackout cuts them to zero.
